GERMINATION INSTRUCTIONS

1. Drop the seeds into a glass of water. The seeds should be left to soak in dark at a temperature between: Celsius 20°- 25° or Fahrenheit 68° - 77°

2. After 6 - 12 hours move the seeds onto a plate, between two moist layers of cotton paper. Keep in mind that seeds also need oxygen to germinate.

3. If you use toilet paper use multiple plies to form a thick layer. Leave the germination plate in a closed dark space and make sure to keep the layers moist do not soak them.

4. Usually within 48 - 72 hours seeds split their casing shell. Seeds can take up to 5 - 6 days to germinate, so be patient. When the white, initial root is visible, the seed is ready to be planted.

5. Place the seed with the tap root facing down into a medium suited for seedlings. Keep the medium moist, the seedling usually begins to grow within 2-5 days.
